

SOLUTION / TESTING AUTOMATION

Release faster with evidence you trust.

BELTO can replace fragile or incomplete release checks with repeatable test layers around consequential journeys. Keep fixtures, data, results and ownership clear so a failed test helps engineering diagnose the problem.

WHAT WE CAN BUILD FOR YOU

A dependable regression suite

Map critical journeys, build stable fixtures and test layers, and connect their results to the release decision.

Value: Spend less time rerunning flaky checks and investigating failures with no diagnostic context.

Cross-system release evidence

Exercise representative integrations, performance and recovery scenarios with controlled data and environment behavior.

Value: Catch consequential failures that isolated component tests can miss before they reach users.

Choose this when manual regression, flaky suites or missed cross-system failures delay confident deployment.

WHAT YOU RECEIVE

Risk-led automation strategy / Reusable test harnesses / Acceptance and release evidence / Suite ownership and maintenance model

Delivery: Risk model / Test architecture / Harness build / Release controls / Operational extension

HOW WE MAKE THE VALUE VISIBLE

Flaky-test rate / Diagnosis time / Escaped defects

ILLUSTRATIVE APPLICATIONS / SCOPED TO YOUR SYSTEMS

Let's scope the first useful step.

Bring the main user journey, prototype or requirements and the team that will own the application.
